Who we are

The Agri-Food Chain Coalition (AFCC) is a joint initiative representing 12 leading associations across the agri-food system. Members represent European farmers, cooperatives and companies from agriculture and livestock sector, farm equipment, plant and animal breeders, fertilizers, crop protection, animal health, feed and biotechnology-based products and the agricultural trade.

What we stand for

The Agri-Food Chain Coalition is united in their call for sustainable, solution-orientated and innovative policy that benefits the EU citizens and economy. The AFCC is committed to addressing the dual challenge of climate change and a growing population and is encouraging innovative solutions for a more sustainable agri-food system in Europe.

Challenges and opportunities

Europe has the ambition to become a net zero emission economy by 2050 and to promote circular economy & bioeconomy as a means to combat climate change, increase resource efficiency and minimise environmental footprint.

- Between 1990 and 2016, emissions from EU agriculture fell by 22%. Partners along the agri-food chain coalition can contribute not only by further reducing emissions in agriculture but also by applying mitigation technologies.
- The agri-food systems are ideally placed to improve current circularities and create new resource loops.
- The agriculture sector can act as a carbon sink through better soil management, by producing the increased amount of biomass needed as well as by reducing production losses and waste along the chain.
- The use of IT and the data has grown immensely in agriculture, and especially in precision agriculture and food sectors.
- The UN Sustainable Development Goals (SDGs) reflect the ambition of humankind to improve the conditions under which we live by addressing current global challenges. European agri-food systems are committed to addressing these challenges by promoting innovative and sustainable practices that will help transform the European agri-food systems.
- The agriculture sector can act as a carbon sink through better soil management, by producing the increased amount of biomass needed as well as by reducing production losses and waste along the chain.
